

1. Create a nodeJS script that displays an html file with two textboxes and four buttons. The first textbox is to enter the source file name, the second textbox is to enter the destination file name.

The four buttons are mentioned as below :

Read, write, append, delete

If read button is pressed-> contents of first file will be displayed on browser

If Write button is pressed-> Contents of first file will be written into second file

If append button is pressed-> Contents of first file will be appended into second file

If delete button is pressed-> first file should be deleted

2. Create a calculator application using nodeJS as per the following requirement. First screen shows two radio buttons, one for simple and other for scientific calculators. Whichever button is selected, based on that the second webpage will appear.

In any of the calculators, the user can perform the arithmetic operations and also is able to store, view and delete his last five calculations. There should be a hyperlink for Exit on each calculator page. When the user will click on it, then he will be redirected to the first page (having two radio buttons)
